

PERSEIDS — Cheat Sheet

Captures audio into up to 5 **Trails**. Builds a stereo sound cloud from it: Spectra (stylized additive) blended with Swarm (grains), plus Resonator, Filter, Reverb and spatial motion. Multi Dry/Wet balances clean input against the finished cloud.

Block pot opens menu, turn = edits (pickup)	Cycle hold+turn = scroll parameter list	Cycle long = delete all Trails (confirm)	Trail enc. short = Lock / back to Home
Trail enc. long = Solo	Imprint short = Play/Pause · long = Lock all Trails	Multi long = Home	Rec = manual capture

1 • Trails — Pot 1

How many voices live in the cloud, and when recording starts.

CNT	Count: 1–5 Trails. Fewer = sparser; more = denser stack.
THR	Threshold: How loud the input must be for auto-record. Lower = more sensitive.
CRE	Cont. Rec: OFF = rising edge only. ON = keep re-arming while above Threshold.
OVR	Overwrite: ON = replace the oldest unlocked Trail, even mid-Hold. OFF = wait for an Empty slot.
ON	On/Off: Capture system on or off.

2 • Time — Pot 2

How long each take is, how long it stays, how it breathes.

BUF	Buffer: Max. recording length (up to 30s). Short = tight loops; long = wide phrases.
HLD	Hold: How long a Trail stays. Far right → INF.
FIN	Fade In: Soft onset of every Trail (also Play fade-in).
FOUT	Fade Out: Soft tail before Empty (also Pause fade-out).

5 • Swarm — Pot 4

Granular texture. Under high CPU load, the Load Governor automatically throttles grains ("L!" in the header).

SIZ	Size: Short grains = busy. Long = smeared pad.
SPR	Spread: Stereo width of the grains.
SCN	Scan: 0 = freeze in the buffer. Turn up = scrub through the recording.
DIR	Direction: Fwd · Rev · Rnd — grain playback direction (Rnd = coin flip per grain).
ATM	Atmosphere: Left = Blur (soft). Right = Radiation (lo-fi / warble).

9 • Crossfade — Pot 9

A loudness focus travels through the Trails.

AMP	Amplitude: 0% = equal. Higher = stronger spotlight on one Trail.
VEL	Velocity: Travel speed; side of center = direction. Center = freeze.

10 • Filter — Pot 10

Tone shaping on a chosen wet stage (never on dry listen-through).

CUT	Cutoff: Brightness of the filtered stage.
RES	Resonance: Peak at cutoff — whistle / bloom.
FBK	Feedback: Drive / growl into the filter.
DST	Destination: Off · Inp · Sp · Sw · Rv — where the filter sits.

3 • Engines — Pot 3

Balance between the two engines and their pitch.

BLD	Blend: Toward Spectra (SP) or Swarm (SW). Center = both at once.
PSP	Pitch Spectra: ±1 octave on the additive body. Center = original.
PSW	Pitch Swarm: ±1 octave on the grains.

4 • Spectra — Pot 5

Stylized harmonic body — character resynthesis, not a transparent freeze.

PAR	Partials: Fewer = simpler. More = denser harmonics.
WSH	Waveshape: Center = sine · left = saw-like · right = fold / sharp.
UMB	Umbra/Aurora: Left = airy (Umbra). Right = vocal/formant (Aurora). Center = neutral.
ENS	Ensemble/Drift: Organic chorus / detune shimmer.

6 • Reverb — Pot 8

Space around the cloud — not around the dry input.

MIX	Mix: How much reverb on the cloud.
DEC	Decay: Reverb tail length.
DMP	Damping: Higher = darker, softer tail.
CHR	Character: Left = Chorus (lush). Right = Friction (saturated wall). Center = normal.

7 • Resonator — Pot 7

Pitched ring on the Swarm side.

MIX	Mix: How much resonant ring vs. dry Swarm.
DEC	Decay: Ring time, 0.08–8s, exponential — short pluck vs. sustained hum.
DMP	Damping: Wood↔metal. 0 = all modes ring equally long (glassy). High = upper modes die first (struck wooden body).
SPR	Spread: Fans the modes across the stereo field, root stays centered. 0 = mono.
PIT	Pitch: Root of the bank (±1 octave).
QNT	Quantized: OFF = odd harmonics. ON = scale from Settings (SCL/INT).

8 • Pan Drift — Pot 6

Trails wander left/right on their own.

PHS	Phase: 0% = synced. 100% = each Trail in its own rhythm.
AMP	Amplitude: How far L↔R. Zero = centered.
VEL	Velocity: Speed & direction. Center = still.

PERSEIDS — Play Ideas

Page 2/2 — Combinations worth trying

A few combinations spanning several blocks that are worth trying — all of them rely only on features that are already implemented.

Slowly ride Blend SP→SW

Morph from harmonic-additive to grainy-granular over several minutes — works well for long ambient transitions without a hard cut.

Imprint on the highlight moment

Press short exactly when it sounds good — freezes the active Trails while new recordings layer on top. Builds up layers without losing the moment.

Detune Pitch Spectra/Swarm in opposite directions

One engine up, the other down — blending between them smears the sound across octaves instead of switching cleanly.

Step through Filter Destination, Cutoff fixed

Leave Cutoff/Resonance alone, only switch DST (Input→Spectra→Swarm→Reverb) — immediately hear how differently the same filter curve feels depending on the signal stage.

Threshold high + Overwrite OFF

Only the loudest/most important moments of a set get captured at all and stay put — deliberately collects highlights instead of constantly overwriting.

Scan=0 (Freeze) + step through Lock/Solo

Swarm freezes at one point in the buffer; step through the 5 Trails individually via Lock/Solo — browse deliberately through frozen texture snapshots.

Ride Reverb Character live between Chorus/Friction

Turn from lush-shimmering (left) to a saturated wall of distortion (right) while a Trail decays — the reverb itself becomes an expressive tool.

Combine high Pan Drift Phase + slow Crossfade

Trails wander independently in space AND a loudness focus slowly travels along — produces a sound picture that never repeats exactly.
